Abstract: Elimination of children's learning difficulties is the highest goal of pedagogues today. For this, first of all, it is necessary to find the root of their difficulties and, accordingly, eliminate them. In this article, the importance of their age in the development of children with unique abilities and the ways to develop their talent, what games and techniques can be used are considered.

Key words: knowledge, ability, technologies, materials.

Nowadays, learning English is becoming a very important field. In the past, this language was studied simply out of curiosity, and today it is gaining importance. Of course, one of the reasons for this is that English has become a common language in the world market. Whereas, today every parent wants their children to learn English. This has led to an increase in the hours of English language classes in preschools and schools. It requires a lot of effort from teachers.

We face many problems in teaching language to children. Their lack of interest in language, their difficulty with rules and word structures make this process much more difficult. But such difficulties are not difficult for children under the age of three. Age is important in language teaching. First of all, parents can be a teacher for a child. According to Dr. Shinichi Suzuki, giving children education and training before the age of three will have a great effect. This is because children under the age of three remember things in terms of shapes. That is, when you tell them the grammar or the meaning of the words, they don't understand what they are, they just memorize them.

As it is said that the knowledge acquired at a young age is like a pattern carved in stone, the knowledge acquired before the age of three is the foundation of the knowledge acquired in the future. The extent to which a child can later learn information depends on the knowledge he has acquired from birth to three years of age. An example of this is Mozart. His sister played the piano a lot when he was a little boy. And Mozart watched him. This has been repeated many times. As a result, Mozart played the piano independently, without anyone's help when he was three years old. . Of course, many people were surprised by this. But the reason

for this is not that he has a divine ability to play the piano, but that he remembers playing the piano as a form.

New technologies play a big role in language teaching to children. Nowadays it is difficult to imagine modern lessons without new technologies. The use of technology to make training more interesting and effective is very effective. Therefore, this method can be applied to children younger than three years old. Children can be taught words as well as actions by playing songs. In addition, giving children videos intended for younger children also has its own effectiveness.

A child's brain, which has just seen the blue sky of this world, can easily take in difficult information, just as it has a lot of stuff in its head. Of course, this process is difficult for adults, but it is much easier for children under three years old. New technologies play a big role in language teaching to children. Nowadays it is difficult to imagine modern lessons without new technologies. The use of technology to make training more interesting and effective is very effective. Therefore, this method can be applied to children younger than three years old. Children can be taught words as well as actions by playing songs. In addition, giving children videos intended for younger children also has its own effectiveness. For children under the age of three, it can be enough to give them various video tutorials or radio broadcasts. They unconsciously memorize the speaker's words. In the process, they both acquire knowledge and learn to pronounce correctly.

Many parents argue that they should teach their children when they are older, but this is wrong. They unwittingly cause their children to become illiterate or difficult learners. Parents' telling their child about the surrounding events from a young age and even during mother's pregnancy creates an interest in the new world in the child's memory and even a little understanding is formed. When the child is born, he begins to analyze and synthesize the environment. At such a time, showing children colorful books, reading them in roles, showing more nature is a big reason for their development and revealing their unique abilities. Reading books in different languages to them creates an understanding of the language being taught to them. In such cases, it is not recommended to read aloud or in the one rhythm. The particular reason for circumstance in this process, the child learns exactly what the parents said and the ability in them. It is necessary to give children as much complex knowledge as possible. As I mentioned at the beginning, a newborn baby is like a blank piece of paper. Whatever you teach them they absorb admirably and you will witness the result yourself in the future.

Every child has its own undiscovered edges. Developing children's ability related to the child's growing environment. Every born baby has his own creativity and ability for every field. It depends on his parents and surrounding objects to direct and reveal it properly. Children should be placed in a room full of colorful

objects, not in an empty room. It develops his creativity and interest in things, thus the child can easily find the direction his interest. Objects and events around children can reveal their unexpected abilities. We can give as an example the mathematic Carl Friedrich Gauss. he was not the son of a scientist, his father was just bricklayer. Gauss often took his son to work. Maybe Carl was good at math because he counted bricks. Children should be given so many opportunities. They will definitely show their abilities in the future.

The materials which are should be given to children are very important in language teaching. They must be attractive. K.D. Shinseki says that before teaching children a language, it is necessary to introduce their culture, customs and traditions. It increases creativity in them. And this can be taught through dramatization. Teaching children the importance of language by acting out small stories or fairy tales is also a very effective way to teach them. In the process of staging, you can use from toys, dolls, pictures or colorful papers. Materials can also be presented to children in this way. Through this method, they learn why language is needed, They increase their vocabulary, become more receptive to communication with people, and think more deeply.

In conclusion, the age of children is very important in teaching process. The ability of young children to receive information is much better than that of adults. Teaching from a young age can be very beneficial for the future. It is never too early to teach. The longer it is taught, the faster the result will be obtained. It certainly requires strength and patience from teachers and parents. Many results can be achieved through patience.
