

ALHAGI MAURORUM O'SIMLIGININING MIKRO VA MAKROELEMENTLARNI MIQDORIY TAHLILI

B.B.Kholmurodov, Sh.Sh.Sadulloyeva

*Tashkent Chemical Technology Institute of Shahrisabz branch. Republic of
Uzbekistan. Shahrisabz
bahodirxolmurodov1994@gmail.com*

Anotatsiya: Alhagi maurorum butasimon suvsiz mintaqalarda o'suvchi yovvoyi o'simlik. Ushbu sharhda alhagi maurorum osimligining yer ustki qismlari ya'ni urug' va barg qismlarida makro va mikroelementlar miqdori induktiv bog'langan plazma massa spektrometriyasi (icp-ms) yordamida 61 ta elementlar miqdori tahlil qindi. Natijalarga asosan Alhagi maurorum urug' qismida barg qismiga nisbatan P, K, Ti, Cr, Ni, Cu, Zn, Rb elementlar miqdori ko'proqligi Barg qismida esa urug' qismiga nisbatan Li, Be, B, Na, Mg, Al, Ca, Sc, V, Mn, Fe, Co, Ga, As, Se, Sr, Y, Zr, Nb, Mo, Ag, Cd, In, Sn, Cs, Ba, Ce, Pr, Nd, Sm, Eu, Gd, Dy, Re, Pb, Th, U elementlari ko'pligi aniqlandi. Qolgan elementlar miqdori esa bir-biriga yaqin miqdordaligi kuzatildi.

Kalit so'zlar: Alhagi maurorum, mikro element, makro element, bog'langan plazma massa spektrometriyasi, ISPMS

Alhagi maurorum ko'plab farmatsevtik xususiyatlarga ega yovvoyi o'tdir. Plantae shohligi, Fabales tartibi, Fabaceae oilasi va Alhagi jinsiga tegishli. Qadim zamonlardan beri odamlar Alhagi maurorumdan nafas olish, jigar, yurak-qon tomir, oshqozon-ichak, immun va siydik va jinsiy tizimlar bilan bog'liq ko'plab kasalliklarni davolash uchun foydalanganlar [1].

Yaqin Sharqdagi an'anaviy dorivor o'simlik Alhagi maurorum ekstrakti (AME) ning biofilm hosil qiluvchi Proteus mirabilis izolatlariga infektsiyaga qarshi ta'siri Janthinobacterium lividum (ATCC 12472) yordamida hujayra madaniyati va

agar qoplamasи tahlilida in vitro adezyon tahlili bilan o'rganildi. Bunga asosan AME genlarni nishonga olgan holda P. mirabilisda biofilm shakllanishini kamaytirgan va AME P. mirabilisga qarshi va anti-QS faolligini ko'rsatgan [2].

A.maurorum ildizining etanol ekstraktining fitokimyoviy tarkibi gaz xromatografiysi-mass-spektroskopiyasi (GC-MS) yordamida o'rganilgan. A. maurorum ildizi ekstraktida aniqlangan 32 ta kimyoviy tarkib dorivor foydalari bo'lgan faol birikmalari yallig'lanishga qarshi, antibakterial, saratonga qarshi ta'sirlari aniqlangan [3].

Alhagi maurorumning bargi, poyasi va urug'lari xromatografiya yo'li bilan tahlil qilinganda flavonoidlar sinfiga mansub degidrokersetin, rutin, kversetin, lutein, senerozid moddalari aniqlangan. Ushbu flavonoidlar tabiiy antioksidant hisoblanadi. Alhagi maurorum barglari, poyalari va urug'larining er usti qismlarini umumlashtirilgan holatda ishlatish tavsiya etilgan [4].

Alhagi maurorum kukuni qo'shilgan non namunalarining kimyoviy tarkibi va minerallar tarkibi tahlil natijalariga asosan Alhagi maurorum kukunida kaltsiy, fosfor va temir kabi ba'zi muhim minerallardan tashqari ko'p miqdorda protein va xom tola mavjudligini ko'rsatdi. Alhagi maurorum kukuni tola, kul, lipidlarni ko'paytirib, namlik, oqsil, uglevodlar kamaytirgan. Alhagi maurorum kukuni qo'shilishi ozuqaviy tarkibni yaxshiladi, ammo qabul qilinishini pasaytirdi [5].

Minerallar bizning organizmimiz uchun muhim tarkibiy qismidir. Ular suyaklarimiz uchun qurilish materiallari, mushak va asab funktsiyasiga ta'sir qilish va tanadagi suv muvozanatini tartibga solish kabi turli xil funktsiyalarni bajaradi. Ular, shuningdek, gormonlar va fermentlar va boshqa biologik faol birikmalarning tarkibiy qismidir. Ba'zi minerallar immunitet tizimining optimal ishlashida ham muhim rol o'ynaydi. Bu tug'ma mudofaa tizimiga ham, adaptiv immunitetga ham tegishli. Shunga ko'ra, minerallar ta'minoti infektsiyalarga sezuvchanlikka ta'sir

qilishi mumkin, ammo u surunkali kasalliklarning rivojlanishiga ham ta'sir qiladi [6].

O'zbekiston respublikasi Qashqadaryo hududida ungan Alhagi maurorum o'simligi quruq massaga nisbatan minerallar tarkibi "O'zbek geologiya qidiruv" AJ markaziy laboratoriyasida tahlil jarayonlari olib borildi.

Namunalarni tayyorlash jarayonida 0,0500-0,5000 g tekshiriluvchi moddaning aniq namunasi analitik tarozida tortiladi va teflon avtoklavlarga o'tkaziladi. Keyin avtoklavlar tegishli miqdorda tozalangan konsentrangan mineral kislotalar (azot kislotasi (h/s) va vodorod periks (h/s)) bilan to'ldiriladi. Avtoklavlar yopiladi va MWS-3+ dasturi yoki shunga o'xshash mikroto'lqinli hazm qilish moslamasi yordamida Berghofc mikroto'lqinli hazm qilish qurilmasiga joylashtiriladi. O'rganilayotgan moddaning turiga qarab parchalanish dasturini aniqlang, parchalanish darajasini va avtoklavlar sonini ko'rsating (12 donagacha).

Parchalangandan so'ng avtoklavlardagi tarkib miqdoriy jihatdan 50 yoki 100 ml hajmli o'lchov kolbalariga o'tkaziladi va hajmi 0,5% nitrat kislotasi bilan belgiga moslashtiriladi.

O'rganilayotgan moddani aniqlash ISPMS qurilmasi yoki induktiv bog'langan argon plazmasi bo'lgan shunga o'xshash optik emissiya spektrometri qurilmasi yordamida amalga oshiriladi. Aniqlash usulida aniqlanadigan mikro yoki makroelementlarning optimal to'lqin uzunligi ko'rsatiladi, bunda ular maksimal emissiyaga ega.

Ma'lumotni olgandan so'ng, sinov namunasidagi moddaning haqiqiy miqdoriy tarkibi qurilma tomonidan avtomatik ravishda hisoblab chiqiladi va xatolik chegaralari bilan mg / kg yoki mkg / g shaklida kiritiladi - RSD% da.

1-jadval

Alhagi maurorum o'simligini induktiv bog'langan plazma massa spektrometriyasi (icp-ms) yordamida aniqlangan mikro va makroelementlarni miqdori

| № | Element | Aniqlanuvchi elementlarning o'lchov diapazoni | Miqdoriy tarkib mg/kg | | |
|---|-----------------------|---|---|--|--------------------------------|
| | | | Alhagi maurorum urug'i Qashqadaryo hududi | Alhagi maurorum bargi Qashqadaryo hududi | Alhagi maurorum Xorazim hududi |
| 1 | Litiy (Li) | 0.05-4000 | 2.10 | 3.80 | 2.32 |

Tahlil natijalarga asosan Alhagi maurorum urug' qismida barg qismiga nisbatan P, K, Ti, Cr, Ni, Cu, Zn, Rb elementlar miqdori ko'proqligi Barg qismida esa urug' qismiga nisbatan Li, Be, B, Na, Mg, Al, Ca, Sc, V, Mn, Fe, Co, Ga, As, Se, Sr, Y, Zr, Nb, Mo, Ag, Cd, In, Sn, Cs, Ba, Ce, Pr, Nd, Sm, Eu, Gd, Dy, Re, Pb, Th, U elementlari ko'pligi aniqlandi. Qolgan elementlar miqdori esa bir-biriga yaqin miqdordaligi kuzatildi (1 va 2 rasmlar).

1-rasm. Alhagi maurorum tarkibiy qismlari minerallarining 10 mg/kg miqdordan yuqori elementlarining taqqoslash diagrammasi

O'simlik tarkibida kaltsiy elementi eng ko'p konsentratsiyada ekanligi aniqlandi. Eng kam miqdorda esa Niobi elementi saqlashi tahlil natijasida aniqlandi.

2-rasm. Alhagi maurorum tarkibiy qismlari minerallarining 10 mg/kg miqdordan kam elementlarining taqqoslash diagrammasi Alhagi maurorum tarkibiy qismlari minerallarining 10 mg/kg miqdordan yuqori elementlarining taqqoslash diagrammasi
